

# FIREVIEW™

# Dashboard

Today's emergency management and public safety agencies face challenges well beyond responding to calls for service or dealing with large scale events. Fire departments are overrun with data from multiple sources. Making sense of it all is a daunting task yet necessary in order to fulfill the needs of each community. A response strategy that relies on data driven decisions has just become much easier.

## DASHBOARD IS A FORCE MULTIPLIER

FireView Dashboard is the next generation of resource allocation and management tools for fire and emergency management agencies. It allows users to analyze event data by providing an interactive view of recent events displayed in the form of maps, charts and reports. FireView Dashboard is a CLOUD based SaaS solution that can be customized to meet the needs of each user group.

## DATA DRIVEN AUTOMATION

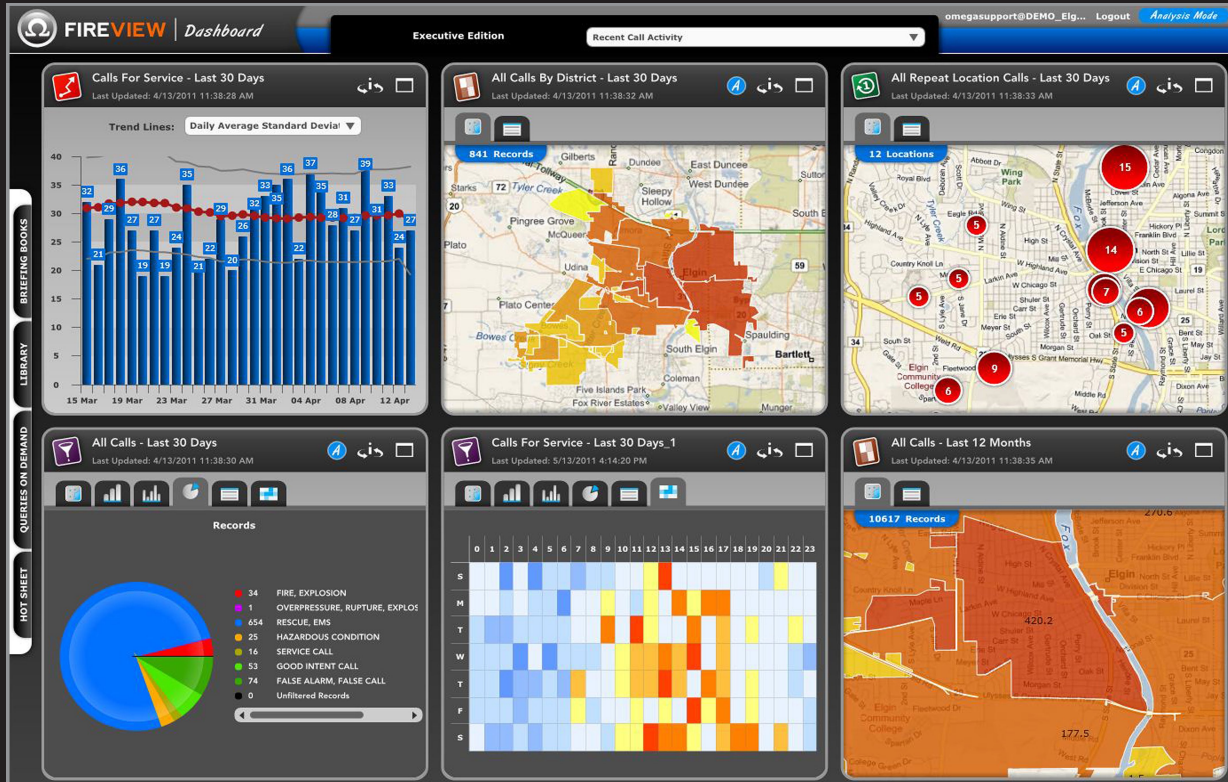

FireView Dashboard rests on Esri's powerful ArcGIS Server mapping engine and organizes complex information from multiple databases into visualizations that provide an instant view of current activity. The entire data integration process is automated so that the information being consumed is always current. Data can be imported from any records or dispatch system and quickly viewed in several formats including heat maps, repeat call locations, temporal charts and temporal grids. These visuals allow for the rapid dissemination and assessment of critical information throughout an entire organization. Accreditation, risk assessment, standards of cover and 1710 compliance issues are all elements that can be addressed with our dashboard. FireView Dashboard provides for two methods of investigation which include Dashboard Mode and Analysis Mode. Dashboard Mode is comprised of Briefing Books, Pages and Widgets. Analysis Mode allows for in depth queries based on such categories as call type, date and location.
