

**OVERVIEW OF
PUBLIC SAFETY SOLUTIONS**

The Omega Group is dedicated to enriching the quality of life in communities by providing solutions for public safety and education agencies.

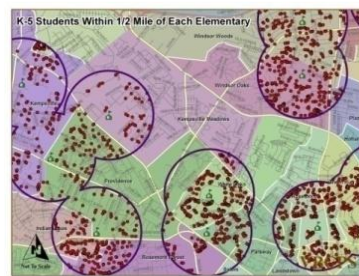

We are the industry-leading developer of innovative Geographic Information Systems software designed to assist public agencies with their daily data driven decisions. Our diverse solution offering distinguishes us in our field and includes demographic analysis, enrollment forecasting, crime analysis, investigative intelligence, 1710 compliance, tactical operations, monitoring critical infrastructure as well as situational awareness. Our complete solutions are highly customized and our exclusive import process represents the very latest in data integration.

Our corporate headquarters are located in San Diego, with a regional office in Philadelphia. We have provided solutions to clients distributed throughout the United States and Canada. The Omega Group has over 450 law enforcement, public safety, and public education clients using our solutions. We are proud to have been in business since 1992.

FIREVIEW®

FIREVIEW® provides Fire and Emergency Response Agencies with mapping tools to help review existing deployment policies and develop new strategies. FireView integrates Fire and EMS data with GIS allowing agencies to easily map and analyze data. By identifying incident patterns and response effectiveness, resources can be more optimally redeployed.

FireView™ enables you to address NFPA Standard 1710 compliance and ISO audits as well as Standards of Cover through the use of numerous data mining tools. Our solution can be used to locate new stations, redistribute response areas, analyze station coverage, determine first due areas and run orders in order to better serve your community.

"We work with developers on a regular basis in planning future fire services in new areas and use FireView to conduct station response analysis to determine the best locations for future fire stations. This function was previously outsourced to an engineering firm, but with this technology we are able to perform the analysis ourselves."

Mark A. Gaillard, Fire Chief, Goodyear, Arizona

- **Investigate** FIRE/EMS calls for service within any response area, near or at an address or landmark such as an assisted living complex or retirement home.
- **Filter** for incident activity by multiple categories such as call type, location type, unit, response time, date or time.
- **Create** density, hot spot and repeat calls maps which help isolate problem areas.
- **Analyze** response patterns through the use of such routines as Response Time Map and First Due Analysis or Distribution.
- **Determine** the full run orders for any location within the service area.
- **Pinpoint** the number of stations able to respond within a specific response time at any location; also referred to as a Concentration Analysis.
- **Optimize** the response capabilities of Fire/EMS stations. Determine the estimated response zones and incident coverage by drive time or distance.
- **Depict** the average response time or total calls per hour and DOW graphically through the use of our new Temporal Heat Index Reports.

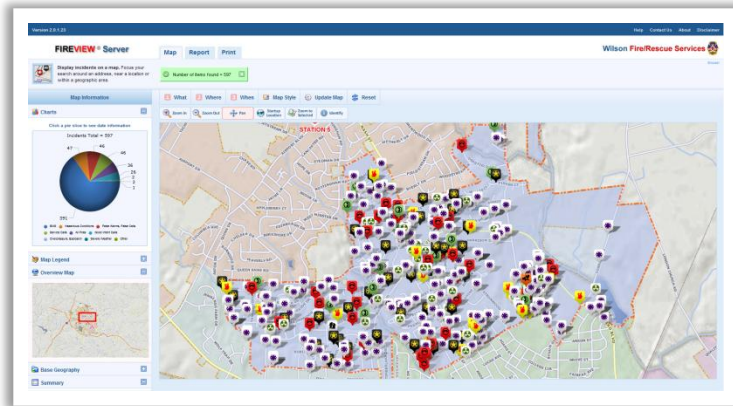

To learn more about how FireView can help your agency address 1710 compliance and improve response planning contact our sales staff toll free at (800)228-1059 or e-mail us at sales@theomegagroup.com for a remote demonstration.

FIREVIEW® Server

FIREVIEW® Server is a thin client application that allows public safety staff to access basic fire analysis tools through a Web browser. By utilizing ESRI's ArcGIS Server solution the need for loading software on individual workstations is eliminated. FireView Server can help establish a **Common Operating Picture** and improve communications throughout your agency.

FireView™ Server helps empower public safety personnel by providing them with information regarding recent FIRE/EMS activity by any geography. This allows for data driven decisions that help to maximize limited resources.

"These tools have improved our reporting to City Council and played an integral role in our accreditation process through the Commission on Fire Accreditation International."

Chad Fitzgerald, Emergency Preparedness Manager,
Clovis, California

FireView Server Advantages:

- **Search** by numerous available categories such as FIRE/EMS call-type, engine or shift. Results include totals by type as well as basic reports.
- **Study** emergency responses by any time period such as time of day, day of week or month.
- **Create** density maps for any boundary layer based on the count of FIRE/EMS calls or true density.
- **Produce** repeat calls layers that depict where FIRE/EMS calls occurred at the same location.
- **Switch** between high resolution satellite imagery and terrain base maps with a single click.

To learn more about how FireView Server can help your agency address 1710 compliance and improve response planning contact our sales staff toll free at (800)228-1059 or e-mail us at sales@theomegagroup.com for a remote demonstration.

OMEGADASHBOARD™

OMEGADASHBOARD™ represents the next generation of resource allocation and management tools for the law enforcement and public safety sectors. Omega Dashboard™ provides users with a timely overview of recent events in the form of reports, maps and charts.

No software is required by the end user as all information is accessed directly through a Web browser. The creation of customized analysis routines is automated so that the information presented is always current.

“We anticipate our dashboard solution improving overall communications within an organization by helping to insure that everyone is on the same page and has the same goals.”

Milan Mueller, President, The Omega Group

Omega Dashboard™ Advantages:

- **Thin Client** - easily access data through a Web browser.
- **Ease of Use** - no knowledge of GIS is required as end results are delivered to your desktop.
- **Customized Views** - each end user can customize their dashboard to meet specific needs.
- **Current Information** – because the dashboard utilizes current data it always represents timely information.
- **Automated** – through the use of Windows Task Scheduler the dashboard is completely automated.
- **Time Saver** - results in the form of reports, maps and charts are delivered without any effort on the end user's part.
- **Security Features** - different access levels can be assigned with multiple usernames and passwords as needed.
- **Advanced Features** - enhanced analyses such as hot spot and response time mapping.
